                                                                                                                                                                                                                                                     The present invention relates to a method of identifying pain-regulating compounds, involving screening candidate compounds for interaction with PIMI or PIM3 kinase. PIM1 and PIM3 proteins and coding sequences are useful for treating chronic pain, particularly of neuropathic or inflammatory origin (e.g. where associated with diabetes, cancer, AIDS or neurodegenerative diseases). The present sequence is human PIM1 kinase
                                                                                                                                                                                                                                                                                                                                    Method for identifying analgesics, useful particularly for chronic pain, by screening compounds for interaction with E kinase, or related compounds.
                                                                                                                                                                                                                                                                                                                      Claim

```
CC polymuclectide in a test cell obtained from the subject and in a normal connectance cell, where an increase in the expression level of TTK protein cor nucleic acid in the test cell compared to that in the normal cell, cornectates the presence of cancer other than ovarian cancer. Also included care reducing growth of a cancerous cell (by contacting a cancerous cell (comprising: (i) detecting the activity of a cancerous cell (comprising: (i) detecting the activity of a contacting a cancerous cell (comprising: (i) detecting the activity of a contacting a cancerous cell (comprising: (i) detecting the activity of a contacting a cancerous cell (comprising: (i) detecting the activity of a contacting the activity of a contacting a cancerous cell displaying a candidate agent contacting a cancerous cell displaying elevated expression of a TTK-cc encoding polymuclectide with a candidate agent; and (ii) detecting the prognosis of a cancerous disease other than ovarian cancer in a contacting a cancerous disease other than ovarian cancer in a control non-cancer cell with a level of expression of the polymuclectide in the test cancer cell of a subject; and (ii) comparing a cancer cell with a level of expression of the polymuclectide in the test cancer cell with a level of expression of the polymuclectide in the test cancer cell with a level of expression of the polymuclectide in the test cancer cell with a level of expression in the control non-cancer cell is contactive to the level of expression in the control non-cancer cell is contactive of the prognosis of the cancerous disease). The methods are cancerous disease other than cancer in a subject, covarian cancer. The methods are also useful for determining the ability of a cancerous cell, identifying an agent that reduces TTK covarian cancer. The methods are also useful for determining the ability of a rational therapy. The present sequence represents a closely related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to detecting cancer (other than ovarian cancer) a subject, comprising comparing the expression levels of tyrosine threonine kinase (TTK, a mitotic checkpoint gene) polypeptide or polymucleotide in a test cell obtained from the subject and in a normal polymucleotide in a test cell obtained from the subject and in a normal polymucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting cancer in a subject, by comparing expression levels of tyrosine threonine kinase polypeptide or polynucleotide in a subject cell and a normal cell, where an increase in the expression level in the test cell is indicative of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 34-35; 79pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             N-PSDB; ACA62265.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2003-456566/43.

The present sequence is the protein sequence of the human CC serine/threonine protein kinase and proto-oncogene, PIM-1. PIM-1 proteins CC are the paralogues of novel human and murine PIM-3 proteins (see ABR62932 CC and ABR62933) of the invention, which are therefore expected to be CC involved in cancer and cell growth regulation. PIM-3 is also involved in the development of insulin resistance and type 2 diabetes mellitus. The CC invention relates to the use of PIM-3 nucleic acids and proteins in: CC screening assays for compounds that modulate insulin resistance or type 2 diabetes mellitus; detection assays for detecting insulin resistance or type 2 diabetes mellitus (e.g. chromosomal mapping, tissue typing, CC forensic biology); predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, pharmacogenomics); and for the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                             New human or murine PIM-3 DNAs or polypeptides, useful for agent for identifying anti-type 2 diabetes mellitus drugs, treating insulin resistance or type 2 diabetes mellitus.

The invention discloses a composition comprising two or more isolated rat
or human polynucleotides or a polynucleotide which represents a fragment,

CC claimed are a vector comprising the nucleic acid sequence. Also Cc claimed are a vector comprising the novel polynucleotide, a host cell Cc comprising the vector, a method for identifying a nucleotide sequence CC which is differentially regulated in an animal subjected to pain and a Ck it to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence CC that is differentially expressed in neuronal tissue of a first animal CC subjected to pain, a method for identifying an agent CC expressed in an animal subjected to pain, a method for identifying a compound which regulates the expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a CC method for identifying a compound or small molecule that regulates the cativity in an animal of one or more of the polypetides given in the specification, a method for identifying a compound useful in treating CC pain and a pharmaceutical composition comprising the one or more composition and a pharmaceutical composition compositing the one or more compound useful in treating compound useful in treating compound useful in treating composition and a pharmaceutical composition compositing the one or more composition and apharmaceutical composition composition composition composition composition or more compound useful in treating compound useful in treating pain. Spinal segmental nerve injury (Chung), chronic constriction composition constriction will be constructed in the sequence of construction will be constructed in the sequence of construction construction will be sequence of construction will be sequence of construction will be sequenced of the printed construction of the printed construction will be constructed construction of the printed construction will be constructed construction of the printed construction will be constructed construction will be cons Sequence 313 AA; ftp.wipo.int/pub/published_pct_sequences.

The present invention relates to a method for identifying a ligand (L), which binds to an inactive conformation of target protein kinase (T). The method involves contacting inactive conformation of (T), which contains or is modified to contain a reactive group at or near a binding site of interest, with one or more ligand candidates capable of covalently bonding to the reactive group thus forming a kinase-(L) conjugate (C). The method is useful for identifying protein kinase inhibitors that preferentially bind to inactive conformation of a target protein kinase. The present sequence is a protein kinase which may be modified via an
                                                                                                                                                                                                                                                                                                    Identifying ligand binding to inactive conformation of target protein kinase (T) comprises contacting the conformation modified (T) which contains reactive group at binding site, with ligands and detecting kinase-ligand conjugate formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21-MAR-2002;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WO2003081210-A2

                                                                                                                              The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, sarcoidosis, autoimmune haemolyric anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating polyneuropathy, Guillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy. This sequence represents a human PRO polypeptide of the

                                                                                                                                                                                                                                                                                                                               The present invention relates to a method of designing a ligand binding to a target molecular. The method involves identifying as molecular scaffolds compounds binding to members of a molecular family, detecting orientation of scaffolds at a binding site of target, and synthesising ligand. The invention is useful for designing drug products and for designing ligand binding to target molecules such as nuclear hormone receptors, TMP receptors, G-protein coupled receptors, methyl protein. This sequence is used to illustrate the method of invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        28-PEB-2002;

osteopathic, antidiabetic, dermatological, antipsoriatic, antiallergic, cantiasthmatic, hepatotropic, and respiratory activity. A polymucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its goodist, antagonist, or antibody that specifically binds to the complex through the polypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, control the properties, and idiopathic inflammatory myopathy, Sjogran's syndrome, systemic sclerosis, and idiopathic inflammatory myopathy, Sjogran's syndrome, systemic control thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, a demyelinating disease of the central or peripheral nervous system, idiopathic demyelinating polymeuropathy, Guillain-Barre syndrome, a chronic inflammatory demyelinating polymeuropathy, a hepatobiliary disease, infectious or autoimmune chronic active hepatitis, primary contracts of the case, an autoimmune or immune-mediated skin disease, abullous skin disease, arsthma, allergic rhinitis, atopic dermatitis, food hypersensitivity, urticaria, an immunologic disease, abullous skin considered skin disease, as allergic rhinitis, atopic dermatitis, rejection or graft-versus-host disease. The present sequence represents a PRO protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Percent Similarity:

CR7 is a serine/threonine protein kinase involved in T-cell lymphomagenesis. The CR7 gene is identical to the putative proto-oncogene pim-1, which is over-expressed in about 50% of MuLV-induced T-cell lymphomas. Recombinant CR7 polypeptides can be produced e.g. as GST fusions for use as immunogens and as diagnostic and therapeutic agents

                          This invention describes a novel isolated antibody or antibody fragment (I) which selectively binds to a polypeptide encoded by cytokine response gene 2 (CR2) and modulates CR2 activity. The products of the invention have cytostatic, anti-allergic, immunosuppressive and antimicrobial activity. The antibodies are useful as therapeutic agents for regulating cellular proliferation and differentiation and for treating all kinds of cancers, immune diseases such as allergic, autoimmune, and rheumatologic diseases, transplant rejection, and as anti-infectives for fighting viral, bacterial, parasitic and fungal infections. This sequence represents the human CR7 protein described in the invention
                                                                                                                                                                                                                                              Novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CR2; human; antibody; cytokine response gene; cytostatic; anti-allergic; immunosuppressive; antimicrobial; therapy; cell proliferation; treatment; cell differentiation; cancer; immune disease; rheumatologic disease; transplant rejection; anti-infective; CR7.

Claim 1; SEQ ID NO 22; 180pp; English.

The present invention describes a method for identifying a compound (C) that modulates cell cycle arrest. The method comprises contacting a cell comprising a target polypeptide with the compound (C), where the target polypeptide encoded by the complement of a nucleic acid that hybridises cunder stringent conditions to a nucleic acid encoding a polypeptide encoded by the complement of a nucleic acid that hybridises conditions are selected from 18 148-1408 amino acid condulating cell cycle arrest in a subject; (2) a CK2-specific short condulating cell cycle arrest in a subject; (2) a CK2-specific short contributing cell cycle arrest in a subject; (2) a CK2-specific short contributing expression of a CK2 gene in a cell; (2) a PIM1-specific siRNA molecule comprising the sequence: (II) conducted as a pairs in length; (3) inhibiting expression of a CK2 gene in a cell; (4) a PIM1-specific siRNA molecule comprising the sequence: (II) capacity (6) an Hbol-specific siRNA molecule comprising the sequence: (III) capacity (6) an Hbol-specific siRNA molecule comprising the sequence: (III) capacity (6) and conducted comprising the sequence: (III) capacity (C) has pairs in length; and (7) inhibiting expression of a PIM1 gene in a cell; (6) an Hbol-specific siRNA molecule comprising the sequence: (III) capacity (C) has pairs in length; and (7) inhibiting expression of an Hbol gene in a cell; (1) capacity (1) capacit

The invention relates to a compound targeted to a nucleic acid molecule encoding the human PIM-1 polypeptide. The compound is an antisense oligonuclectide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcycosine. The antisense compounds are useful for modulating the expression of the human PIM-1 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents the human PIM-1 polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; PIM-1; antisense oligonucleotide; phosphorothioate 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; cytostatic.
                                                                                                                                                                                                                                                                                       New compound that modulates PIM-1 expression, useful in treating animal having a disease or condition, i.e. hyperproliferative dis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  US-10-705-757-1 (1-2623) x ABG33016
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         human HKID-1 polypeptide, a member of serine/threonine kinase superfamily. The method involves contacting a cell expressing the polypeptide or nucleic acid with an agent to modulate the level or activity of polypeptide, or level of nucleic acid molecule. The method i useful for modulating the level or activity of HKID-1 polypeptide or polypucleotide in a subject having or predisposed to having a disorder involving cancer. Modulating HKID-1 expression or activity is useful for therapeutic purposes, for treating cellular proliferative and/or differentiative disorders including cancer or haematopoietic neoplastic disorders e.g. Acute promyeloid leukaemia (APML), Chronic myelogenous leukaemia (CML) and Waldenstrom's macroglobulinaemia (WM). This is the amino acid sequence of a rat protein kinase phosphorylation site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modulating levels or activity of HKID-1 polypeptides, a member of serine/threonine kinase superfamily, for treating cancer, by contacting cell expressing the polypeptide with a modulator of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a method of modulating the level or activity human HKID-1 polypeptide, a member of serine/threonine kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 3; Page 39-40; 48pp; English.

Sequence 8, Application US/09971791

Patent No. US20020115120A1

GENERAL INFORMATION:

APPLICANT: Rosanna Kapeller-Libermann
APPLICANT: ROSanna Kapeller-Libermann
APPLICANT: Kyle MacBeth
ITITLE OF INVENTION: NOVEL MOLECULES OF THE HKID-1-RELATED PROTEIN FAMILY AND USES
PILE REFERENCE: 35800/238856

CURRENT APPLICATION NUMBER: US/09/971,791

CURRENT FILING DATE: 2001-10-04
PRIOR APPLICATION NUMBER: 09/644,450
PRIOR APPLICATION NUMBER: 09/237,543
PRIOR FILING DATE: 1909-01-26

NUMBER OF SEQ ID NOS: 11
SOFTMARE: FastSEQ for Windows Version 4.0

LENGTH: 313

C -!- FUNCTION: Thought to play a role in signal transduction in blood cells. May affect the structure or silencing of chromatin by phosphorylating HP1 gamma/CBX3.

C -!- FUNCTION: Thought to PR9 (By similarity).

C -!- SUBUNIT: Binds to RP9 (By similarity).

C -!- SUBUNIT: Binds to RP9 (By similarity) in cells of the hematopoletic and germ line lineages.

C -!- FINSIDE SPECIFICITY: Expressed primarily in cells of the hematopoletic and germ line lineages.

C -!- FINI Autophosphorylated on tyrosine residues.

C -!- SIMILARITY: Belongs to the Ser/Thr protein kinase family. PIM

Immuno]. Immunopathol. 78:177-195(2001).
-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-!- SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).
-!- PTM: Autophosphorylated (By similarity).
-!- SIMILARITY: Belongs to the Ser/Thr protein kinase family. PIM subfamily.
